

• KNN classification steps:

① Data Pre-processing -

```
df = pd.read_csv('___')  
x = df.drop('target', axis = 1)  
y = df['target']  
Train-test-Split
```

② Create & Train KNN Classifier -

```
from sklearn.neighbors import KNeighborsClassifier  
knn-clf = KNC(n-neighbors = 5, p = 2,  
               metric = 'minkowski')  
knn-clf.fit(x-train, y-train)
```

③ Predict Test Set Results -

```
y-pred = knn-clf.predict(x-test)
```

④ Evaluate Model Performance -

```
from sklearn.metrics import  
accuracy_score(y-test, y-pred)  
confusion_matrix(y-test, y-pred)  
classification_report(y-test, y-pred)
```
