

## • KNN Regression steps :-

### ① Data Pre-processing -

```
df = pd.read_csv('___')  
x = df.drop('target', axis=1)  
y = df['target']  
Train-Test-Split
```

### ② Create & Train KNN Regressor -

```
from sklearn.neighbors import KNeighborsRegressor  
knn-regr = KNR(n-neighbors=5)
```

### ③ Predict Test Set Results -

```
y-pred = knn-regr.predict(x-test)
```

### ④ Evaluate Model Performance -

```
from sklearn.metrics import  
mae = mean-absolute-error(y-test, y-pred)  
mse = mean-squared-error(y-test, y-pred)  
rmse = np.sqrt(mse)  
r2 = r2-score(y-test, y-pred)
```
