

• Simple Linear Regression Implementation:-

① Import Libraries - `pd, np, plt.`

② Import Dataset - `df = pd.read_csv('___')`

③ EDA -

- Null value treatment.
- Remove duplicates
- Handle categorical data.

④ Split Dataset - `from sklearn.model_selection ⇒ train_test_split`
`X = df.drop('target', axis = 1)`
`Y = df['target']`

`x_train, x_test, y_train, y_test = train_test_split(X, Y, test_size = 0.2, random_state = 42)`

⑤ Training Model - `from sklearn.linear_model ⇒ LinearRegression`
`regressor = LinearRegression()`
`regressor.fit(x_train, y_train)`

⑥ Result Prediction -

`y_pred = regressor.predict(x_test)`

⑦ Model Evaluation - `from sklearn.metrics ⇒ r2_score, mean_squared_error`
Find model's goodness of fit.

`r2 = r2_score(y_test, y_pred)`

`sq_err = mean_squared_error(y_test, y_pred)`
